

← Terminal - Learn Linux Terminal Basics

The Terminal is an interactive, text-based interface for your Operating System. When you type a command, you're basically telling your computer to do something very specific. Many commands will print information to the screen. Some will ask for input, and others may just return you to a prompt.

The quickest way to install, remove or update applications is through the Terminal. The Terminal is also referred to as the shell, command line, prompt, or command prompt.

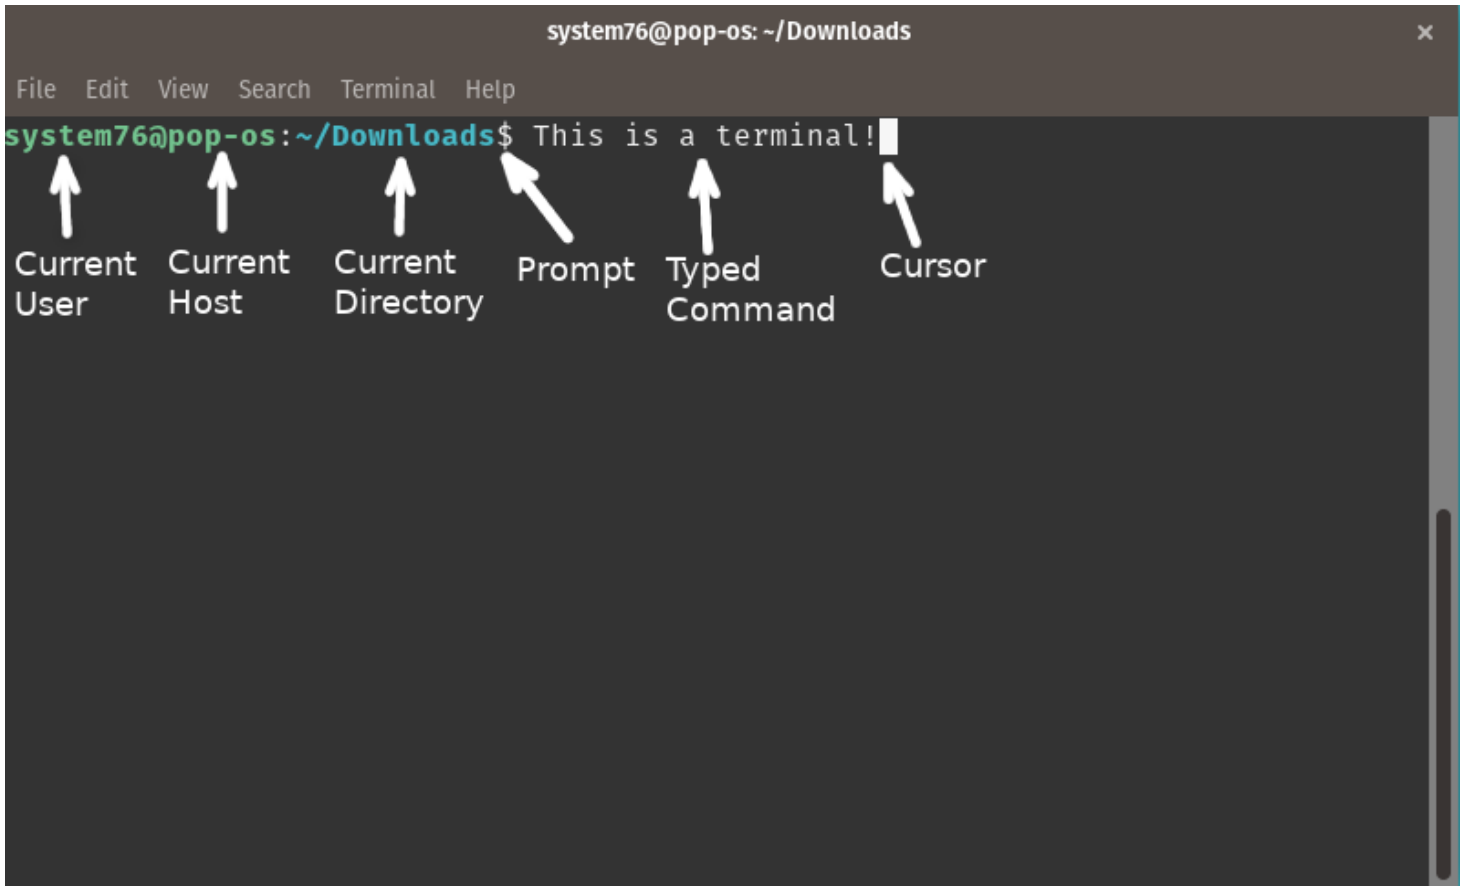

To open a Terminal, tap the Super Key  to search your computer and type the word Terminal.

A box like the one below will appear:

Navigating The Terminal

It might not look like much, and at first glance there might not appear to be much information, but the Terminal is one of the most powerful tools at your disposal. Take a look:

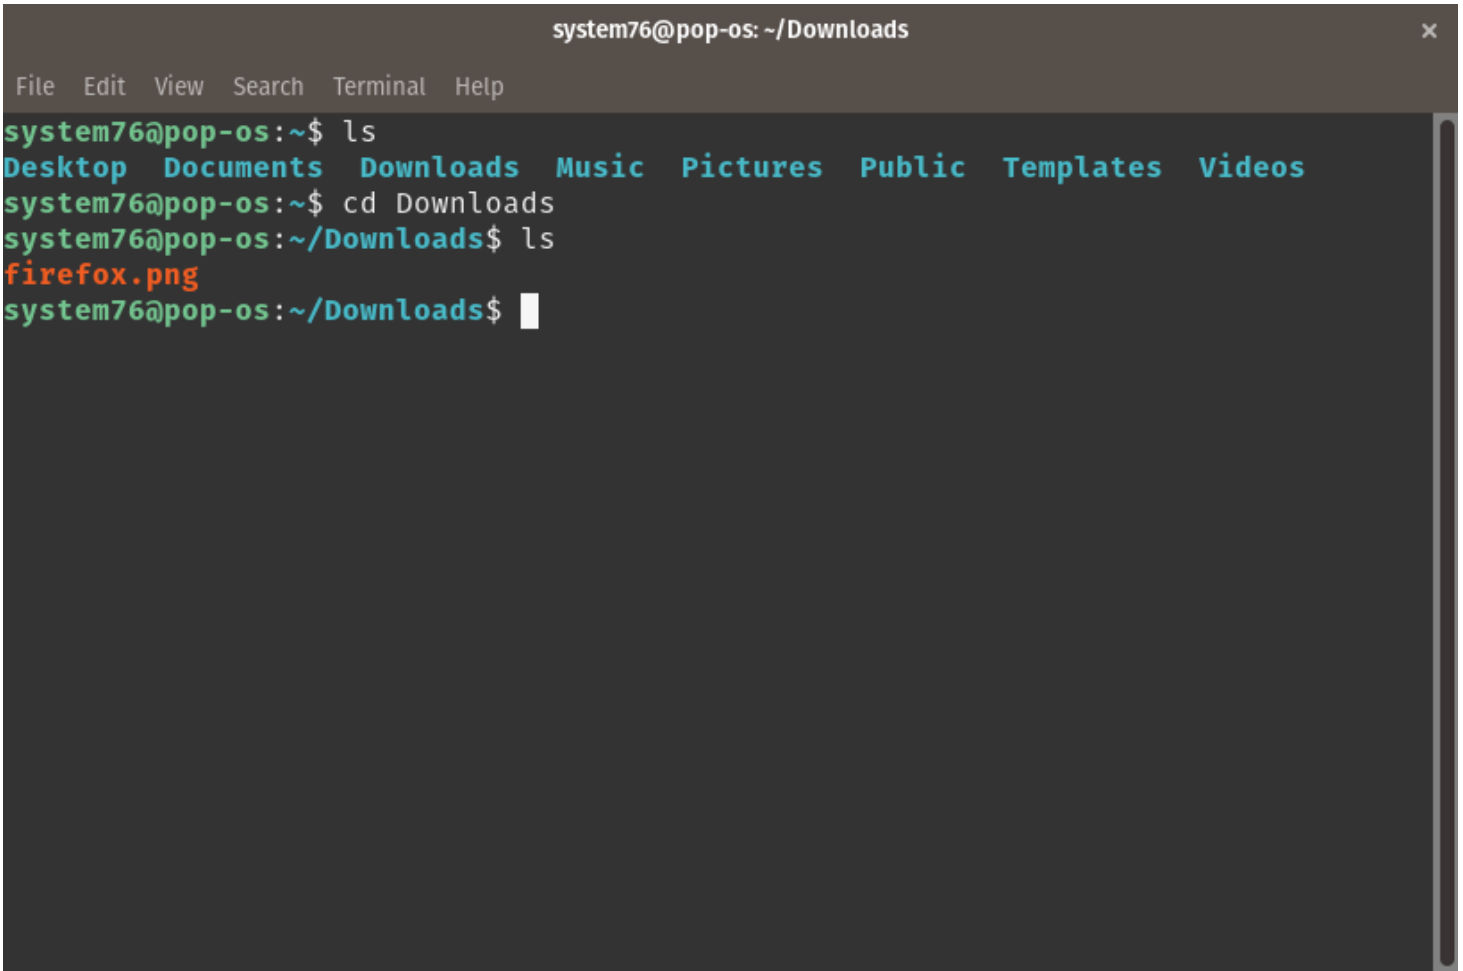

Section Description

Current User	The username of the person currently logged in to this Terminal .
Current Host	The hostname of the system currently in use by the Terminal . Unless you've connected to a remote machine via SSH, this will be the same name as your computer.
Current Directory	The current folder that this Terminal resides in. Commands entered and files modified are scoped to this folder, unless providing an absolute path to another file or folder, or if the command is available in the user's \$PATH. Basically, the Terminal can only see into this folder. A tilde (~) indicates the user's home directory.
Prompt	Anything entered after this symbol is interpreted as a command.
Typed Command	Anything that is typed into the Terminal is shown after the prompt.
Cursor	A visual indicator of the user's current position in the Terminal .

As you change folders and move throughout your computer, the prompt will change in response. In many cases, you won't need to move around to run a command.

To list all files and folders in the current directory, type `ls`. To change directories (folders), type `cd [directory name]`. To go back up a directory type `cd ..`. At any time, you can press the Tab key to have the [Terminal](#) guess the completion for your entry, or twice to show all possibilities.

```
system76@pop-os: ~/Downloads
File Edit View Search Terminal Help
system76@pop-os:~$ ls
Desktop Documents Downloads Music Pictures Public Templates Videos
system76@pop-os:~$ cd Downloads
system76@pop-os:~/Downloads$ ls
firefox.png
system76@pop-os:~/Downloads$
```

Running Elevated Commands

In most cases, the Terminal prevents you from damaging your system by requiring authentication or elevated privileges to run certain commands. For example, to check for updates you will need to prepend the command `apt update` with `sudo`. Below is an example of the same command, ran once without `sudo` and once with.

```
system76@pop-os: ~/Downloads
File Edit View Search Terminal Help
system76@pop-os:~/Downloads$ apt update
Reading package lists... Done
W: chmod 0700 of directory /var/lib/apt/lists/partial failed - SetupAPTPartialDirectory (1: Operation not permitted)
E: Could not open lock file /var/lib/apt/lists/lock - open (13: Permission denied)
E: Unable to lock directory /var/lib/apt/lists/
W: Problem unlinking the file /var/cache/apt/pkgcache.bin - RemoveCaches (13: Permission denied)
W: Problem unlinking the file /var/cache/apt/srcpkgcache.bin - RemoveCaches (13: Permission denied)
system76@pop-os:~/Downloads$ sudo apt update
[sudo] password for system76:

2 packages can be upgraded. Run 'apt list --upgradable' to see them.
system76@pop-os:~/Downloads$
```

When you run a command with `sudo` in front of it, you'll be prompted for your password. When typing your password, you won't see anything. Just enter your password and then press . If it's entered incorrectly, the [Terminal](#) will let you know and give you another chance to enter your password.

Useful Commands:

```
sudo apt update
```

This command will tell your system to search for potential updates and advise if there are any available, but this command does not install them.

```
sudo apt upgrade
```

This command will download and apply any updates to your System76 computer.

```
sudo apt full-upgrade
```

This command will upgrade your packages and installs or remove packages to resolve dependencies so everything is up-to-date.

```
sudo apt install [application]
```

This will install a particular application and its dependencies on your computer.

```
sudo apt purge [application]
```

This will remove a program and it's configuration files from your computer.

```
man sudo
```

The `man` command is short for manual. You can type the `man` command in front of any command that you want more information about.
